

The Three Types of Modern Women and How to Fall in Love With Them: A Bitcoin and Blockchain Analogy

On Compatibility, Autonomy, and the Architecture of Love

Abstract

One of the persistent mistakes people make in love is assuming that the person they love must first become more available, less ambitious, less guarded, or more receptive to their particular form of affection before a meaningful relationship can exist.

But people do not enter relationships as empty spaces waiting to be occupied. They arrive with histories, commitments, ambitions, habits, identities, and entire systems of meaning already operating within their lives.

Some are emotionally committed elsewhere. Some have organised their lives around ambitious long-term goals. Others have developed a culture of humour, memes, irony, and playful detachment through which they interpret the world.

These differences can appear to be barriers to love. Yet

perhaps the mistake lies not in the existence of these barriers, but in assuming that love must eliminate them.

Borrowing from *The Long Game*, *The Two Threads of Attention*, and *Proof of Movement*, this paper proposes a different approach: a form of love that accounts for the architecture of another person's life instead of treating that architecture as a problem to solve.

The central argument is simple:

Love should not require the destruction of the system into which it hopes to be integrated.

Bitcoin and blockchain offer a useful analogy. A functioning network has existing rules, established histories, independent participants, and mechanisms through which trust is developed. A new participant cannot simply demand that the entire network reorganise itself around their arrival.

They must understand the system, determine whether participation is possible, respect its rules, and demonstrate their intentions through time.

Likewise, loving someone well requires more than intensity. It requires understanding, patience, compatibility, and evidence of commitment.

This paper explores three recurring romantic configurations and proposes a distinct approach to each.

1. The Three Types

These are not scientific categories or mutually exclusive personality types. They are three idealised extremes that can overlap, alternate, and change throughout a person's life.

Type One: The Woman Whose Heart Is Already on Another Chain

She is already deeply in love with someone else.

Her emotional life has a history. Her memories, loyalties, hopes, and attachments are connected to another person. These connections may be so deeply established that your affection struggles to find a place within them.

You may be kind. You may be intelligent. You may understand her in ways she appreciates. You may even offer qualities that her existing relationship lacks.

Yet none of these things automatically makes her available to you.

The mistake is assuming that sufficient love should eventually overpower her existing attachment.

It treats her heart as an empty wallet into which you must deposit enough affection to displace its current contents.

But love is not a bidding war, and a person's feelings are not a blockchain transaction that can be reversed merely because another participant offers a better deal.

The problem is not necessarily that your love is insufficient. It may be that her emotional commitments are directed elsewhere.

The Bitcoin analogy: An established chain

Imagine a blockchain with an established transaction history.

The chain contains previous transactions, relationships between participants, and a history that cannot simply be erased because a new node has joined the network.

Your arrival does not invalidate what came before.

In the same way, loving this woman means recognising that her emotional history belongs to her. You cannot demand that she rewrite it to accommodate your feelings.

The relevant question is not:

How do I break through the walls separating her from me?

It is:

Is there a legitimate place for me in her life, and does she

want to make room for one?

The proposed solution: Love without invasion

The first principle is to stop treating her existing attachment as an enemy you must defeat.

If she is committed to someone else, respect that commitment. Do not turn patience into a covert strategy for waiting until her relationship fails. Do not mistake her kindness for romantic interest or assume that your persistence creates a debt she must eventually repay.

If she becomes genuinely available and expresses an interest in you, a new relationship may become possible.

Until then, your love must be capable of existing without demanding possession.

This is not passive suffering. It is the recognition that another person's freedom is part of what makes loving them meaningful.

Sometimes the most honest expression of love is to remain available only to the extent that doing so is healthy for you. Sometimes it is to step away.

You can honour what you feel without claiming ownership of what she feels.

Type Two: The Woman Running Her Own Protocol

She has built her life around goals and ambitions so precise that your love can seem perpetually insufficient.

She may be pursuing an education, building a business, developing a profession, supporting her family, mastering a craft, or working toward a vision that has occupied years of her life.

Her priorities are not necessarily evidence of emotional coldness.

She may love deeply while refusing to make romance the organising principle of her existence.

You offer attention, but she has deadlines. You offer spontaneous outings, but she has a plan. You want more time together, but she is protecting the time required to become the person she intends to be.

The mistake is interpreting every boundary as rejection.

A second mistake is assuming that, if she truly loved you, she would automatically reorganise her ambitions around your preferred level of closeness.

That expectation turns love into a competition between the relationship and the rest of her life.

The question is not how to become more important than her ambitions. It is whether the two of you can build a relationship in which love and ambition can coexist.

The Bitcoin analogy: An independent protocol

A blockchain operates according to its protocol. Its rules are not discarded whenever a new participant arrives.

A new node must understand how the network operates before it can participate meaningfully.

Similarly, this woman has established rules for how she allocates her time, energy, and attention. Her goals may have been chosen long before you arrived, and their value does not depend on whether you understand them immediately.

Loving her does not mean becoming another administrator attempting to control her system.

It means understanding the system well enough to determine whether your lives can connect without either person having to abandon their essential commitments.

There is, however, an important distinction: human relationships are not literally computer protocols. People can negotiate, revise priorities, and change their minds.

Respecting her existing structure does not mean that your needs must remain permanently unspoken.

Compatibility requires room for both people.

The proposed solution: Build for the long game

This is where *The Long Game* becomes especially relevant.

The paper asks us to consider the slowest practical path to a goal before committing to it. If the goal remains worth pursuing under unfavourable conditions, commitment no longer depends entirely on an ideal timeline.

Apply the same question to love.

Suppose building a relationship with this woman means accepting a slower pace than you initially wanted.

Suppose she cannot always respond immediately, cannot meet as often as you would prefer, or needs sustained periods of concentration to pursue her ambitions.

Suppose the relationship develops through small, consistent moments rather than constant availability.

Would you still want to build that relationship?

And, equally important, would she want to build it with you?

These questions distinguish genuine compatibility from the fantasy of eventually becoming someone's highest priority in

every circumstance.

The answer is not to demand that she become less ambitious. Nor is it to suppress your own need for affection indefinitely.

Instead, negotiate a sustainable arrangement.

Perhaps it involves planned time together, clear communication about busy periods, mutual support for each other's projects, and realistic expectations about availability.

The aim is not to win against her ambitions. It is to establish a relationship that can survive alongside them.

Love the person she is becoming, but do not disappear while helping her become that person.

Type Three: The Woman Whose World Runs on Memes

She has built a significant part of her identity around memes, humour, irony, playful absurdity, and the ability to turn almost any situation into a joke.

You try to express affection sincerely, and she responds with a meme.

You attempt a serious conversation, and she introduces a joke.

You send a heartfelt message, and suddenly your romantic confession has become the subject of a running gag.

Sometimes the humour is simply her personality. Sometimes it is a shared language through which she expresses affection. Sometimes humour makes difficult subjects easier to approach. And sometimes it may help her avoid a conversation she does not want to have.

The important thing is not to assume that every joke is a defence mechanism or that every meme hides a deeper emotional truth.

The mistake is believing that your love must force her to abandon the language through which she ordinarily experiences the world.

You are attempting to communicate through sincerity with someone who may also communicate through absurdity. Neither language must automatically invalidate the other.

The Bitcoin analogy: The mempool and the meme coin

In blockchain systems, a mempool is a place where pending transactions may wait before being included in a block. A meme coin, by contrast, is a type of cryptocurrency whose identity or appeal is often closely associated with internet humour, cultural references, or online communities.

These are different concepts, and neither is a literal model of a person's emotional life. But together, they offer two useful metaphors.

The mempool reminds us that not every message is immediately processed. Timing, availability, and the surrounding system matter.

The meme coin reminds us that humour can become a shared culture, not merely a distraction from something more serious.

For this woman, humour may be part of the actual substance of connection.

If you insist that every meaningful exchange must be solemn, you may be asking her to communicate in a language that feels unnatural to her.

But if every serious concern is permanently converted into a joke, intimacy may never develop beyond entertainment.

The goal is to make room for both playfulness and sincerity.

The proposed solution: Learn the language without losing your own

Start by entering her world without pretending to be someone you are not.

Share a joke. Understand her references. Develop an appreciation for the absurdities she notices. Let humour become one of the ways you create shared experiences.

But do not confuse the ability to make each other laugh with the ability to communicate about everything.

A relationship also needs moments when both people can speak honestly about their feelings, expectations, insecurities, and boundaries.

You might say, playfully, that you are willing to communicate in memes but would occasionally appreciate a direct answer.

You might establish a shared understanding that some conversations can be funny while others deserve undivided attention.

And you should be willing to recognise the difference between a person who jokes because humour is how she connects and a person who repeatedly refuses the vulnerability necessary for the relationship you want.

The distinction must emerge from conversation and experience, not from a theory imposed upon her.

Love her humour without reducing her to a joke. And allow yourself to be loved without becoming one.

2. The Unified Solution: Love as Compatible Participation

The three configurations appear different, but they reveal a common mistake.

We often approach love as though our feelings grant us a claim on another person's attention, priorities, or emotional availability.

We assume that if our love is sufficiently sincere, it should eventually overcome whatever stands between us and the relationship we desire.

But sincerity does not guarantee compatibility. Intensity does not guarantee reciprocity. Persistence does not create consent.

The three papers suggest another approach.

Principle One: Establish the baseline before committing

From *The Long Game*.

Before pursuing a relationship, ask what it would actually require under realistic conditions.

Not under the ideal circumstances in which she is always available, her existing attachments disappear, her ambitions become convenient, and your communication styles align effortlessly.

Consider the slowest practical version of the relationship that both people would genuinely want.

Could you sustain it?

Would it still meet your essential needs?

Would she also consider it worthwhile?

This is not an argument for accepting every limitation. It is an argument for deciding what you are committing to before spending years trying to transform the situation into something else.

Principle Two: Understand the two threads of attention

From *The Two Threads of Attention*.

The paper distinguishes between forms of engagement that may remain possible even when demanding, structured work becomes difficult.

Transferred cautiously to relationships, this suggests that attention has different expressions.

A woman may enjoy your company, laugh at your messages, follow your work, or enjoy exchanging ideas without necessarily being ready for a committed relationship.

These are meaningful forms of engagement, but they do not automatically establish romantic commitment.

Likewise, a person may be too occupied to engage frequently while still showing genuine interest through reliable, intentional communication.

The important task is to distinguish between the kind of connection that is present and the kind of relationship you are hoping to build.

Do not mistake frequent interaction for commitment.

Do not mistake limited interaction for rejection without considering context.

Look at the wider pattern, communicate your expectations, and allow her words and choices to clarify what the connection means.

Principle Three: Look for proof of movement

From *Proof of Movement*.

The paper argues that commitment should produce recurring, directed actions that leave evidence behind.

Love can be expressed through words, but a relationship develops through what both people actually do.

Does she make time for you when she can?

Does she communicate honestly?

Does she respect your boundaries?

Do you support her goals without making that support conditional on receiving affection?

Can both of you discuss disagreements and make adjustments?

Are your efforts gradually producing a relationship that both people want?

These questions matter more than declarations of limitless patience.

And the standard applies to both people. You should not be the only participant providing evidence of commitment.

Love does not need to prove that it can conquer a wall. It needs to establish whether two people are willing to build a door together.

3. A Blockchain Model of Love

We can now combine the three frameworks into a single conceptual model.

Imagine a relationship as a network in which two independent participants consider whether to establish a lasting connection.

Each person has an existing history, a set of priorities, limited resources, and the right to determine whether they wish to participate.

A new connection cannot be established through one participant's desire alone.

It requires mutual agreement and continuing participation.

The analogy can be expressed through five components.

1. Existing chain — History

Every person arrives with a past. Their previous relationships, experiences, ambitions, and habits form part of their current reality.

A new relationship must account for this history rather than pretending it does not exist.

2. Protocol — Boundaries and values

Each person has principles and conditions that shape how they wish to live and relate to others.

A healthy relationship requires discovering where these principles are compatible, where they differ, and what can be negotiated.

3. Bandwidth — Attention and capacity

Time, energy, and emotional availability are limited.

The fact that someone has limited capacity does not automatically mean they lack affection. However, a permanent mismatch in the capacity each person can offer may make a relationship unsustainable.

4. Proof of movement — Consistent action

Intentions become credible through patterns of behaviour.

Both people contribute through communication, reliability, consideration, and actions that support the relationship they have agreed to build.

5. Consensus — Mutual choice

A relationship becomes a shared undertaking only when both

people choose it.

One participant cannot unilaterally declare a relationship into existence, rewrite the other person's priorities, or interpret nonparticipation as a temporary obstacle to overcome.

This final component is essential.

The blockchain analogy is useful precisely because it highlights the limits of unilateral control. But human relationships involve emotions, moral responsibilities, and the capacity to change in ways that technical systems do not. Mutual choice is a necessary condition of a healthy romantic relationship, not a technical feature that software alone can explain.

4. What Does It Mean to Love Each Type?

The proposal can be reduced to three distinct practices.

For the woman whose heart is elsewhere, love requires **respecting history and accepting the limits of your access.**

For the woman whose life is organised around ambition, love requires **designing for the long game without sacrificing mutual needs.**

For the woman whose world runs on memes, love requires

learning her language while preserving the possibility of sincerity.

All three require the same underlying discipline: see the person clearly enough to distinguish who she actually is from who you hope she will become.

This does not mean accepting every situation indefinitely.

You can love someone and still recognise that they are unavailable.

You can admire someone's ambitions and still discover that your desired levels of intimacy are incompatible.

You can appreciate someone's humour and still need conversations that go beyond jokes.

Acceptance is not the absence of standards. It is the decision to stop confusing your standards with a mandate to change another person.

You remain responsible for choosing the relationships you enter, the compromises you make, and the conditions under which you continue.

The other person retains the same freedom.

5. The Final Proposition

The purpose of this framework is not to teach someone how to win over every woman, bypass every defence, or turn every romantic obstacle into a strategy.

That would reproduce the very mistake the framework is intended to correct: treating another person's independence as a challenge to be defeated.

Instead, it proposes that love becomes more intelligent when it stops demanding that people first become easier to love.

Some people have histories that you cannot erase.

Some have ambitions that you should not ask them to abandon.

Some have ways of experiencing the world that differ from your own.

These are not necessarily defects. They are features of the lives they have built.

But recognising them as features does not mean that every configuration is compatible with yours. The aim is not to love without limits; it is to love without attempting to abolish the other person's autonomy.

The Long Game teaches us to examine what we are willing to sustain.

The Two Threads of Attention teaches us to distinguish different forms of engagement.

Proof of Movement teaches us to look for evidence that intention is becoming action.

Together, these frameworks suggest a more mature romantic philosophy:

Understand the system. Establish the baseline. Respect the protocol. Look for mutual movement. And never confuse your desire to connect with another person's obligation to connect with you.

Perhaps the deepest lesson of the blockchain analogy is not that love requires us to find a way into someone else's network.

It is that a lasting relationship cannot be built by one participant alone.

You do not need to break her chain, rewrite her protocol, or turn her memes into declarations of love.

You need to discover whether the two of you can build something together without either person having to cease being themselves.

And if the answer is no, the failure of that particular

connection does not invalidate the love you felt or the life you must continue to build.

The goal is not to conquer the walls. The goal is to discover whether there is a door that both people genuinely want to open.

The Time Spent Learning

You begin with the question of learning.

Not the learning itself,
but the question of it.

How long should one sit?
What makes a lesson stay?
Is repetition enough?
Should the hand write
while the eyes read?
Should the eyes read
while the voice speaks?

You look into these things.

There are methods.
There are better methods.
There are people who have compared them.
There are people who have compared
the people who compared them.

You read about memory.

You learn that memory
is not quite what you thought it was.

You learn about forgetting,
and spacing,
and attention,
and recall.

You make a note of this.

You make another note
to return to the first note.

By then the morning has gone.

Still, something has been learned.

That is the difficulty.

Something has been learned.

Only not the thing
you sat down to learn.

You were going to learn the words.

Instead, you learned
how words are learned.

You were going to read the chapter.

Instead, you read
about reading chapters.

You were going to practise.

Instead, you became
quite interested
in what makes practice effective.

It is not nothing.

Of course it is not nothing.

One must know how to begin.

One must know what helps.

One must know when to stop
thinking about beginning.

And perhaps this is the part
that requires the most learning:

to notice that one is still
learning about learning.

So you close the article.

You put away the notes.

You decide that tomorrow
you will simply learn.

Which is a good decision.

You spend a little time
thinking about how good
the decision is.

Then you wonder
whether thinking about learning
has itself become a kind of learning.

It probably has.

You make a note of that.

And by then the morning
has gone.

You make a note of that.

And by then the morning
has gone.

Still, there is the afternoon.

There is time enough.

You sit down again
with the intention
of doing the thing itself.

No more preparation.

No more methods.

No more reading
about memory.

The book is open.

The first line is there.

You read it once.

Then again.

You wonder whether reading it twice
is repetition
or merely reading it twice.

You read it a third time
to find out.

It seems clearer.

Perhaps this is working.

You continue.

After a while
you begin to wonder
whether you are remembering
because you understand
or understanding
because you remember.

You stop.

Not for long.

Just long enough
to think about it.

There are probably studies
about this.

You could look them up.

You do not.

That is progress.

You continue reading.

A word you do not know
appears in the next line.

You could simply learn the word.

But first you wonder

whether looking it up immediately
is better than trying to recall it later.

There is probably a method
for this too.

You already know that.

You also know
what happened last time.

So you do not look it up.

You try to remember.

You cannot.

You look it up.

Now you know the word.

Or you know
that you have looked it up.

There is a difference.

You have read about that difference.

Somewhere.

You remember the article.

Not the word.

You go back.

The word is still there.

So you learn it.

At last.

This, surely,
is the thing.

Not the article,
not the method,
not the question of whether
the method is better than another method,

but this small thing
now sitting in the mind
where it was not sitting before.

You read the next word.

Then the next.

And soon enough
you begin to think

that perhaps this is what learning is:

a long interruption
of thinking about learning
by the occasional act
of learning.

Which is an interesting thought.

You write it down.

You look at what you have written.

You wonder whether writing down
an observation about learning
is itself part of learning.

It might be.

You wonder whether
you should continue.

You probably should.

You look back at the page.

The first word is still there.

You have been sitting here
for some time.

The book is open.

The notes are beside it.

The method has been considered.

The memory has been examined.

The process has been observed.

The word has been learned.

And the time spent learning about learning

has not been the time spent learning.

Though some of it was.

And some of that
was spent deciding
which part was which.

Which is another thing
worth understanding.

Perhaps.

You begin to think about it.

.....

.....

...

...

..

The time spent learning about learning
is not the time spent learning.
It is also not quite
the time spent not learning.
Because while you were thinking about learning,
you learned something.
And while you were learning something,
you thought about learning.
And while thinking about that,
you learned that you had been thinking about it.
Which is useful.
Probably.
But the book is still open
to the same page.

...
